Subject: RE: ArcelorMittal sampling

Update –

For the grab sample, analyze for mercury, oil & grease, phenols, and total residual chlorine.
For the 24-hr composite sample, analyze for ammonia (as nitrogen), lead, total suspended solids, and zinc.

I spoke with Ryan. In short, he thinks it would be best if your contractor does the analysis.

Subject: ArcelorMittal sampling

Hey, Mike. I was able to find what I was looking for immediately after speaking with Simone at ArcelorMittal, so thanks for pointing me in her direction. Here are the parameters I'd like to be analyzed:

Mercury, oil & grease, phenols, and total residual chlorine for any samples taken at Outfalls 009 and 010.
Free cyanide, mercury, oil & grease, and total residual chlorine for any samples taken at Outfall 001.

Thanks,

Ray Cullen, Environmental Engineer
